Given two sparse vectors, compute their dot product.

Implement class `SparseVector` :

SparseVector(nums)

 Initializes the object with the vector `nums`

dotProduct(vec)

 Compute the dot product between the instance of `SparseVector` and `vec`

A **sparse vector** is a vector that has mostly zero values, you should store the sparse vector **efficiently** and compute the dot product between two `SparseVector`.

**Follow up:** What if only one of the vectors is sparse?

Example 1:

Input:

 nums1 = [1,0,0,2,3], nums2 = [0,3,0,4,0]

Output:

 8

Explanation:

 v1 = SparseVector(nums1) , v2 = SparseVector(nums2)

v1.dotProduct(v2) = 1\*0 + 0\*3 + 0\*0 + 2\*4 + 3\*0 = 8

Example 2:

Input:

 nums1 = [0,1,0,0,0], nums2 = [0,0,0,0,2]

Output:

 0

Explanation:

 v1 = SparseVector(nums1) , v2 = SparseVector(nums2)

v1.dotProduct(v2) = 0\*0 + 1\*0 + 0\*0 + 0\*0 + 0\*2 = 0

Example 3:

Input:

 nums1 = [0,1,0,0,2,0,0], nums2 = [1,0,0,0,3,0,4]

Output:

 6

Constraints:

n == nums1.length == nums2.length

1 <= n <= 10^5

0 <= nums1[i], nums2[i] <= 100

class SparseVector {

SparseVector(int[] nums) {

}

// Return the dotProduct of two sparse vectors

public int dotProduct(SparseVector vec) {

}

}

// Your SparseVector object will be instantiated and called as such:

// SparseVector v1 = new SparseVector(nums1);

// SparseVector v2 = new SparseVector(nums2);

// int ans = v1.dotProduct(v2);
